

Linux For Embedded Systems

For Arabs

Course 102: Understanding Linux

Ahmed ElArabawy

Lecture 6: Seeking Help

Why ??

- Linux Command Line Interface is a very rich interface with hundreds of commands
- Each command comes with a lot of variations, options, argument types, ...
- We learn about the popular and frequently used forms but It is impossible to remember all possible usage of commands
- Hence, we need a way to find more information about the different commands and their different usage forms

Help Commands

Command	Effect
\$ man	Read manual pages
\$ whatis	Search man page titles by keywords
\$ apropos	Search the man pages by keywords
\$ info	Read Info pages
\$ <command> -h \$ <command> --help	Display Usage of commands

Reading the Manual Pages (man Command)

\$ man <command> (Read the man page for a Command)

\$ man ls

```
dave@Nostromo: ~  
LS(1)                                User Commands                                LS(1)  
  
NAME  
    ls - list directory contents  
  
SYNOPSIS  
    ls [OPTION]... [FILE]...  
  
DESCRIPTION  
    List information about the FILES (the current directory by default).  
    Sort entries alphabetically if none of -cftuvSUX nor --sort.  
  
    Mandatory arguments to long options are mandatory for short options  
    too.  
  
    -a, --all  
        do not ignore entries starting with .  
  
    -A, --almost-all  
        do not list implied . and ..  
  
    --author  
        with -l, print the author of each file  
Manual page ls(1) line 1
```

LS(1) User Commands LS(1)  
  
NAME  
ls - list directory contents  
  
SYNOPSIS  
ls [OPTION]... [FILE]...  
  
DESCRIPTION  
List information about the FILES (the current directory by default). Sort entries alphabetically if none of -cftuvSUX nor --sort.  
  
Mandatory arguments to long options are mandatory for short options too.  
  
-a, --all  
do not ignore entries starting with .  
  
-A, --almost-all  
do not list implied . and ..  
  
--author  
with -l, print the author of each file  
  
-b, --escape  
print C-style escapes for nongraphic characters  
  
--block-size=SIZE  
use SIZE-byte blocks. See SIZE format below  
  
-B, --ignore-backups  
do not list implied entries ending with ~  
  
-c with -lt: sort by, and show, ctime (time of last modification of file status information) with -l: show ctime and sort by name otherwise: sort by  
ctime  
  
-C list entries by columns  
  
--color[=WHEN]  
colorize the output. WHEN defaults to 'always' or can be 'never' or 'auto'. More info below  
  
-d, --directory  
list directory entries instead of contents, and do not dereference symbolic links  
  
-D, --dired  
generate output designed for Emacs' dired mode  
  
-f do not sort, enable -aU, disable -ls --color  
  
-F, --classify  
append indicator (one of */=>@|) to entries  
  
--file-type  
likewise, except do not append '*'  
  
--format=WORD  
across -x, commas -m, horizontal -x, long -l, single-column -l, verbose -l, vertical -C  
  
--full-time  
like -l --time-style=full-iso  
  
Manual page ls(1) line 1
```

Options are case sensitive

Where are the Manual Pages ??

- The “**man**” command reads from the manual pages stored in your distribution
- The location of these pages may differ slightly based on the distribution
- Use the command ‘**manpath**’ to know the location of the man pages on your machine

\$ manpath

- This command identify the location of the man pages based on the configuration file “***/etc/manpath.cfg***”
- Sometimes we will have an Environment variable ***MANPATH*** for that purpose too

\$ echo \$MANPATH

- Typically they are located in ***/usr/share/man/***

The Manual Sections

- The “man” pages are classified into multiple sections with numbers:
 - (1) for commands
 - (2) for System calls
 - (3) C Library functions
 - (4) Special filenames
 - (5) file formats for Linux files
 - (6) games and things like screen savers
 - (7) word processing packages & Misc
 - (8) System administration commands

Selecting the Manual Section

- We can decide which section we want to show from the man page

\$ man <n> <name>

- Example:

\$ man 1 passwd (manual page for the command ***passwd***)

\$ man 5 passwd (manual page for the ***/etc/passwd*** file)

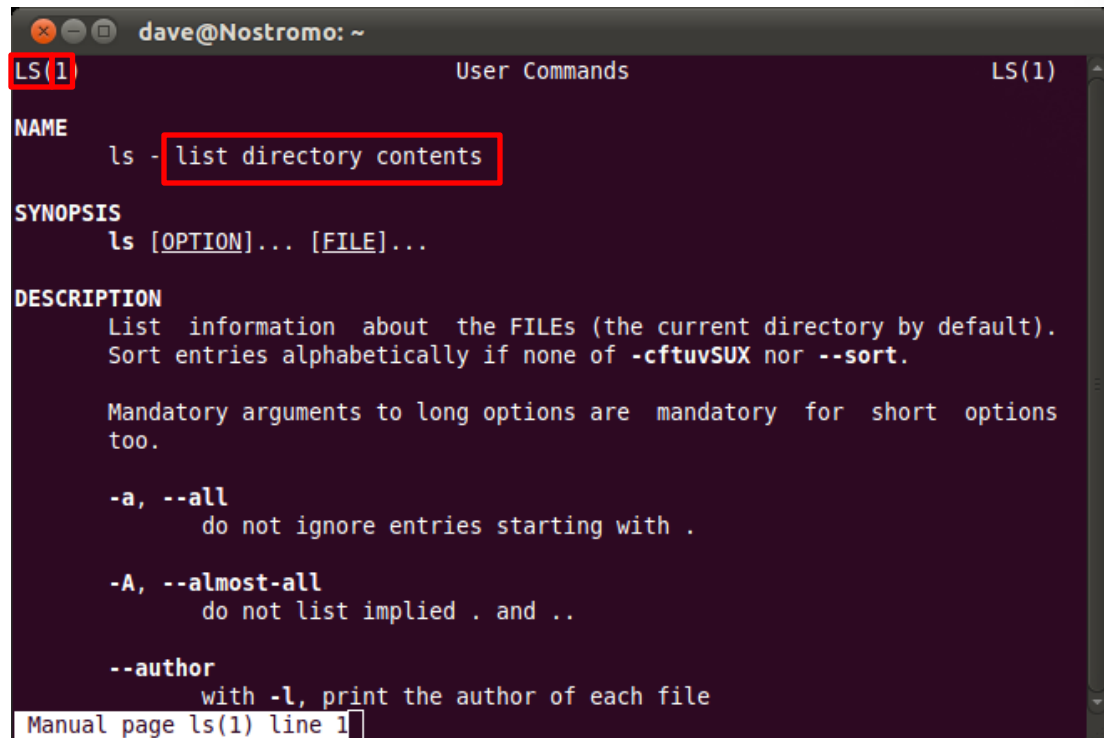

\$ man passwd (Default is section 1; the command)

- To learn more about the man command,

\$ man man

The “whatis” Database

- The ‘**whatis**’ database is a database containing a selected parts of the man pages
 - Title
 - Section Number
 - Name field

```
dave@Nostromo: ~
LS(1) User Commands LS(1)
NAME
  ls - list directory contents
SYNOPSIS
  ls [OPTION]... [FILE]...
DESCRIPTION
  List information about the FILES (the current directory by default).
  Sort entries alphabetically if none of -cftuvSUX nor --sort.

  Mandatory arguments to long options are mandatory for short options
  too.

  -a, --all
      do not ignore entries starting with .

  -A, --almost-all
      do not list implied . and ..

  --author
      with -l, print the author of each file
Manual page ls(1) line 1
```

The “whatis” Database

- The ‘**whatis**’ database is a database containing a selected parts of the man pages
 - Title
 - Section Number
 - Name field
- This database is used with the commands,
\$ whatis
\$ apropos

Search man pages by Title (whatis Command)

\$ *whatis* <keyword> (find the man pages which has keyword in title)

```
sachit@ubuntu:~$ whatis ls
ls (1) - list directory contents
sachit@ubuntu:~$
```

- The “***whatis***” command searches the keyword in the title field in the man pages
- For all matches, it will display one line containing,
 - Title
 - Section Number
 - Description (from Name field)
- Must be a complete word
\$ *whatis* hea (no output will come out)
- We can have multiple keywords
\$ *whatis* head tail

Searching Manual Pages by Keywords (apropos Command)

\$ apropos <keyword> (find the man pages with keyword in title, Name)

- The '**man**' command assumes that you know the command name
- What if you don't know the command name and just have a keyword ??
- The solution is to use '**apropos**' command
- '**apropos**' command receives a keyword, and searches both the 'title' and the 'Name' field in the **whatis** database for this keyword
- It then prints a single line (the Name field) for each command matching the keyword

\$ apropos <keyword>

- Examples:

\$ apropos process (Searches for all commands dealing with process)

\$ apropos proce (even a part of a word can be used)

- Note, the same output can be achieved via,

\$ man -k <keyword>

```
enock@enock-pc: ~  
enock@enock-pc:~$ apropos moc  
mocp (1) - Console audio player  
enock@enock-pc:~$
```

```
josemon@creativemindz: ~  
josemon@creativemindz:~$ apropos who  
at.allow (5) - determine who can submit jobs via at or batch  
at.deny (5) - determine who can submit jobs via at or batch  
bsd-from (1) - print names of those who have sent mail  
from (1) - print names of those who have sent mail  
w (1) - Show who is logged on and what they are doing.  
w.procps (1) - Show who is logged on and what they are doing.  
who (1) - show who is logged on  
whoami (1) - print effective userid  
whois (1) - client for the whois directory service  
josemon@creativemindz:~$
```

Using the Command Info Pages (info Command)

\$ info <Command> (Display the Info pages on the command)

- Info pages are similar to man pages but created by the GNU project for the GNU applications

\$ info gzip

\$ info emacs

- To know more about this command

\$ info info

- The GNU commands will have both man pages and info pages
 - The info pages are usually more recent and are somewhat easier to use
 - Sometimes, the man pages refer to the Info pages

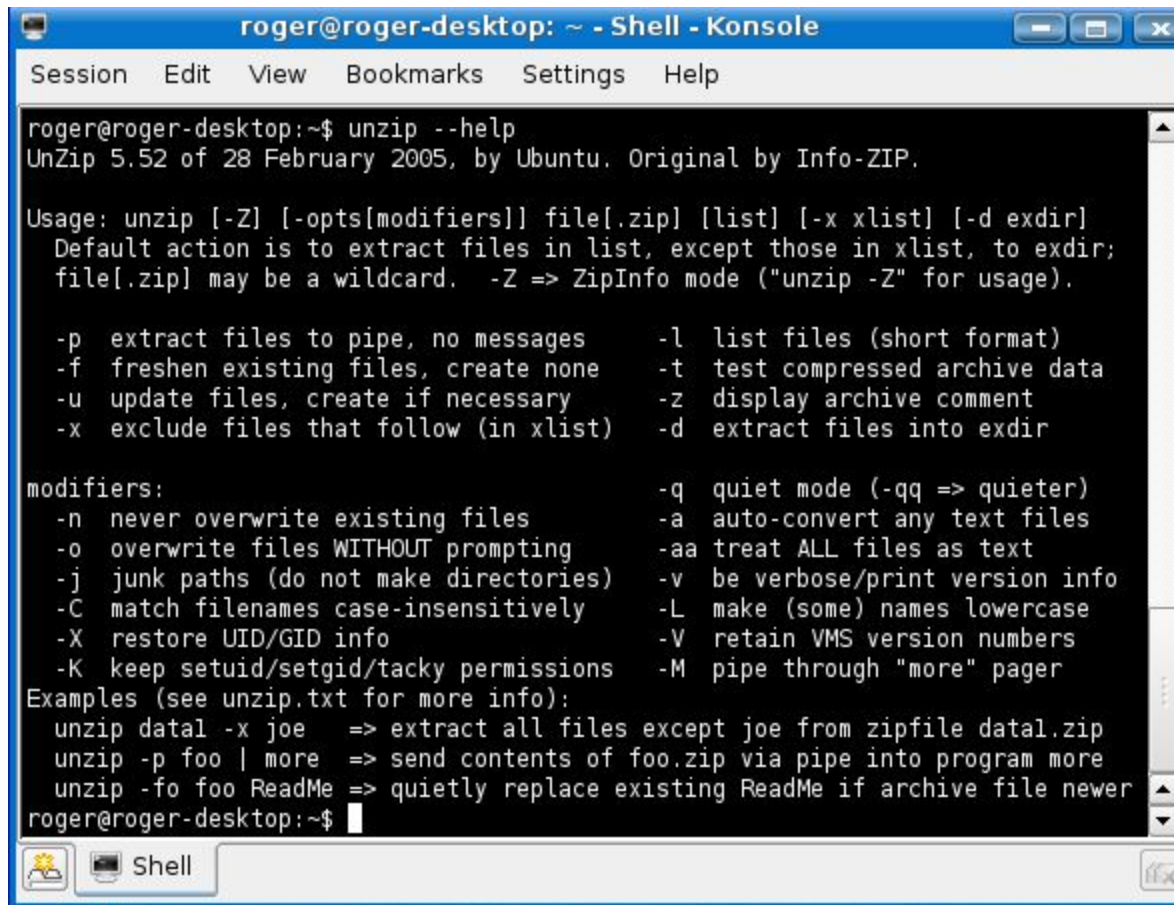

HELP FROM WITHIN

Help From Within

roger@roger-desktop:~$ unzip --help
UnZip 5.52 of 28 February 2005, by Ubuntu. Original by Info-ZIP.

Usage: unzip [-Z] [-opts[modifiers]] file[.zip] [list] [-x xlist] [-d exdir]
Default action is to extract files in list, except those in xlist, to exdir;
file[.zip] may be a wildcard. -Z => ZipInfo mode ("unzip -Z" for usage).

-p extract files to pipe, no messages      -l list files (short format)
-f freshen existing files, create none     -t test compressed archive data
-u update files, create if necessary        -z display archive comment
-x exclude files that follow (in xlist)    -d extract files into exdir

modifiers:
-n never overwrite existing files          -q quiet mode (-qq => quieter)
-o overwrite files WITHOUT prompting       -a auto-convert any text files
-j junk paths (do not make directories)    -aa treat ALL files as text
-C match filenames case-insensitively     -v be verbose/print version info
-X restore UID/GID info                   -L make (some) names lowercase
-K keep setuid/setgid/tacky permissions   -V retain VMS version numbers
-M pipe through "more" pager              -M pipe through "more" pager

Examples (see unzip.txt for more info):
unzip data1 -x joe  => extract all files except joe from zipfile data1.zip
unzip -p foo | more => send contents of foo.zip via pipe into program more
unzip -fo foo ReadMe => quietly replace existing ReadMe if archive file newer

roger@roger-desktop:~$
